

TECHNICAL SHEET

MODEL E5003

Steam jets are a very effective method of cleaning for restoring shine to samples, cleaning models to remove wax residues, and eliminating traces of oxidants left by welding.

In the dentistry field this method is widely used for the decontamination of metal bridges, cleaning models, washing instruments and eliminating residues of the casting process. In general, saturated steam is also suitable for brightening objects, since the items always remain completely dry. Our steam jet cleaners are able to produce "saturated" steam, that is absolutely moisture – free, at a 6 bar pressure. This is essential for rapid in-depth cleaning. Our steam jet cleaners are reliable and safe, extremely compact, useful in thousands of different applications

E 5003

Cheap, compact and easy to use. It is provided with an exclusive system which controls water level inside the boiler automatically cutting off heating when the minimum level is reached and a red light on advises the operator to proceed manually to refill the boiler through the tap on top of the machine. Machine equipment: funnel to be inserted inside the tap to refill water and 1 lt., graduated carafe. Note: the boiler can be filled only when there is no pressure and when the machine is off.

Main features

- ✓ Safe and easy to use.
- ✓ Rapid, in -depth cleaning with saturated steam.
- ✓ Practical foot-control lever for the coming out of the steam.
- ✓ Automatic control of boiler water level.

E5003	MEASURES	VALUES	LENGTH	WIDTH	HEIGHT
